## **As per the National Coordinator . . .**

- **New England Journal of Med 2008:** Low uptake of HIT in ambulatory setting
- **New England Journal of Med 2009** Low uptake in of HIT in hospitals

**Conclusion: \$48B  
investment, pushing  
the technology**

### Medicare Meaningful Use Incentive Payment Schedule

Calendar Year	First Calendar Year in which the Eligible Professional Receives an Incentive Payment				
	2011	2012	2013	2014	2015 +
2011	\$18,000	-----	-----	-----	-----
2012	\$12,000	\$18,000	-----	-----	-----
2013	\$8,000	\$12,000	\$15,000	-----	-----
2014	\$4,000	\$8,000	\$12,000	\$12,000	-----
2015	\$2,000	\$4,000	\$8,000	\$8,000	\$0
2016	-----	\$2,000	\$4,000	\$4,000	\$0
TOTAL	\$44,000	\$44,000	\$39,000	\$24,000	\$0

Cap applies for any eligible professional with at least \$24,000 in Medicare Part B allowable charges in each payment year

**The Goal:**

# A Learning Health System

**But investment is in current stage technologies:  
No data in or out, no communication, terrible UIs**

## Role of Computerized Physician Order Entry Systems in Facilitating Medication Errors

Ross Koppel, PhD

Joshua P. Metlay, MD, PhD

Abigail Cohen, PhD

Brian Abaluck, BS

A. Russell Localio, JD, MPH, MS

Stephen E. Kimmel, MD, MSCE

Brian L. Strom, MD, MPH

**A**DVERSE DRUG EVENTS (ADEs) are estimated to injure or kill more than 770 000 people in hospitals annually.<sup>1</sup> Prescribing errors are the most frequent source.<sup>2-5</sup> Computerized physician order entry (CPOE) systems are widely viewed as crucial for reducing prescribing errors<sup>2,3,6-17</sup> and saving hundreds of billions in annual costs.<sup>18,19</sup> Computerized physician order entry system advocates include researchers, clinicians, hospital administrators, pharmacists, business councils, the Institute of Medicine, state legislatures, health care agencies, and the lay public.<sup>2,3,6-10,12,14-17,20-22</sup> These systems are expected to become more prevalent in response to resident working-hour limitations and related care discontinuities<sup>23</sup> and will supposedly offset causes (eg, job dissatisfaction) and effects

**Context** Hospital computerized physician order entry (CPOE) systems are widely regarded as the technical solution to medication ordering errors, the largest identified source of preventable hospital medical error. Published studies report that CPOE reduces medication errors up to 81%. Few researchers, however, have focused on the existence or types of medication errors facilitated by CPOE.

**Objective** To identify and quantify the role of CPOE in facilitating prescription error risks.

**Design, Setting, and Participants** We performed a qualitative and quantitative study of house staff interaction with a CPOE system at a tertiary-care teaching hospital (2002-2004). We surveyed house staff (N=261; 88% of CPOE users); conducted 5 focus groups and 32 intensive one-on-one interviews with house staff, information technology leaders, pharmacy leaders, attending physicians, and nurses; shadowed house staff and nurses; and observed them using CPOE. Participants included house staff, nurses, and hospital leaders.

**Main Outcome Measure** Examples of medication errors caused or exacerbated by the CPOE system.

**Results** We found that a widely used CPOE system facilitated 22 types of medication error risks. Examples include fragmented CPOE displays that prevent a coherent view of patients' medications, pharmacy inventory displays mistaken for dosage guidelines, ignored antibiotic renewal notices placed on paper charts rather than in the CPOE system, separation of functions that facilitate double dosing and incompatible orders, and inflexible ordering formats generating wrong orders. Three quarters of the house staff reported observing each of these error risks, indicating that they occur weekly or more often. Use of multiple qualitative and survey methods identified and quantified error risks not previously considered, offering many opportunities for error reduction.

**Conclusions** In this study, we found that a leading CPOE system often facilitated medication error risks, with many reported to occur frequently. As CPOE systems are implemented, clinicians and hospitals must attend to errors that these systems cause in addition to errors that they prevent.

## No Small Change for the Health Information Economy

Kenneth D. Mandl, M.D., M.P.H., and Isaac S. Kohane, M.D., Ph.D.

The economic stimulus package signed by President Barack Obama on February 17 included a \$19 billion investment in health information technology. How can we best take advantage of this unprecedented opportunity to computerize health care and stimulate the health information economy while also stimulating the U.S. economy? A health care system adapting to the effects of an aging population, growing expenditures, and a diminishing primary care workforce needs the support

of a flexible information infrastructure that facilitates innovation in wellness, health care, and public health.

Flexibility is critical, since the system will have to function under new policies and in the service of new health care delivery mechanisms, and it will need to incorporate emerging information technologies on an ongoing basis. As we seek to design a system that will constantly evolve and encourage innovation, we can glean lessons from large-scale information-

technology successes in other fields. An essential first lesson is that ideally, system components should be not only interoperable but also substitutable.

The Apple iPhone, for example, uses a software platform with a published interface that allows software developers outside Apple to create applications; there are now nearly 10,000 applications that consumers can download and use with the common phone interface. The platform separates the system from the functional-

## Electronic medical records give early warning of domestic abuse

Posted by Elizabeth Cooney September 29, 2009 07:09 PM

[E-mail](#) | [Link](#) | [Comments \(0\)](#)

Boston researchers reported today a novel use for electronic medical records -- using data in patient records, they say they were able to identify likely victims of domestic abuse an average of two years before a diagnosis was actually made.

**Ben Reis, Dr. Isaac Kohane, and Dr. Kenneth Mandl** of **Children's Hospital Boston** and **Harvard Medical School** studied six years of hospital admissions and emergency visits for patients over 18 years old. Based on the patient's history, including injuries and assaults, they determined whether patients met a definition of domestic abuse. Then they looked at actual diagnoses of domestic abuse.

"Our model predicted abuse two years before it appeared on medical records," Reis said in an interview. The article appears online in the [British Medical Journal](#).

The risk factors linked to a future domestic abuse diagnosis differed between men and women. For women, the red flags were trips to the hospital to treat injuries, poisoning, and alcoholism. For men, depression and psychosis were associated with the greatest risk.

The researchers developed a visual display that could become part of a patient's electronic health record. The work is not ready to be implemented, they said, but the model could form the basis for an early warning system that would help busy doctors decide which patients need further screening and perhaps intervention.

## Domestic Abuse

***British Medical Journal 2009***

Intelligent Health Lab

Children's Hospital  
Informatics Program

Harvard  
Medical School

## Use case 2 (cont)

- The application would require
  - ✓ Comprehensive diagnostic data from primary site of care for each patient (to work well)
  - ✓ Comprehensive diagnostic data from all sites of care (to work very well)

Intelligent Health Lab

Children's Hospital  
Informatics Program

Harvard  
Medical School

- MedTastic may be able to develop apps adapted to several APIs (Cerner's Mpages etc)
- Academic group cannot.
- THEREFORE, focus is on an API that enables a single apps store for
  - ✓ Cerner Install
  - ✓ Hospital with homegrown system
  - ✓ Physician practice
  - ✓ Open source EMR

Intelligent Health Lab

Children's Hospital  
Informatics Program

Harvard  
Medical School

**We imagine EMRs as an iPhone-like platform where Medtastic could create and widely distribute an app across many disparate EMRs**

Intelligent Health Lab

Children's Hospital  
Informatics Program

Harvard  
Medical School

## EHR as an “iPhone-like” Platform

- There is a common application programming interface that enables
  - ✓ Software developers to build **SUSTITUTABLE** applications
    - ➡ Push innovation to the edges
    - ➡ Nimbly evolve functionality
    - ➡ Avoid vendor lock
    - ➡ Shrink switching costs
    - ➡ Enable disruption

Intelligent Health Lab

Children's Hospital  
Informatics Program

Harvard  
Medical School

## Our vocabulary:

- Data Sources (managed by containers)
- Containers (present data from data sources to apps in a uniform fashion)
- Apps (completely substitutable)

Intelligent Health Lab

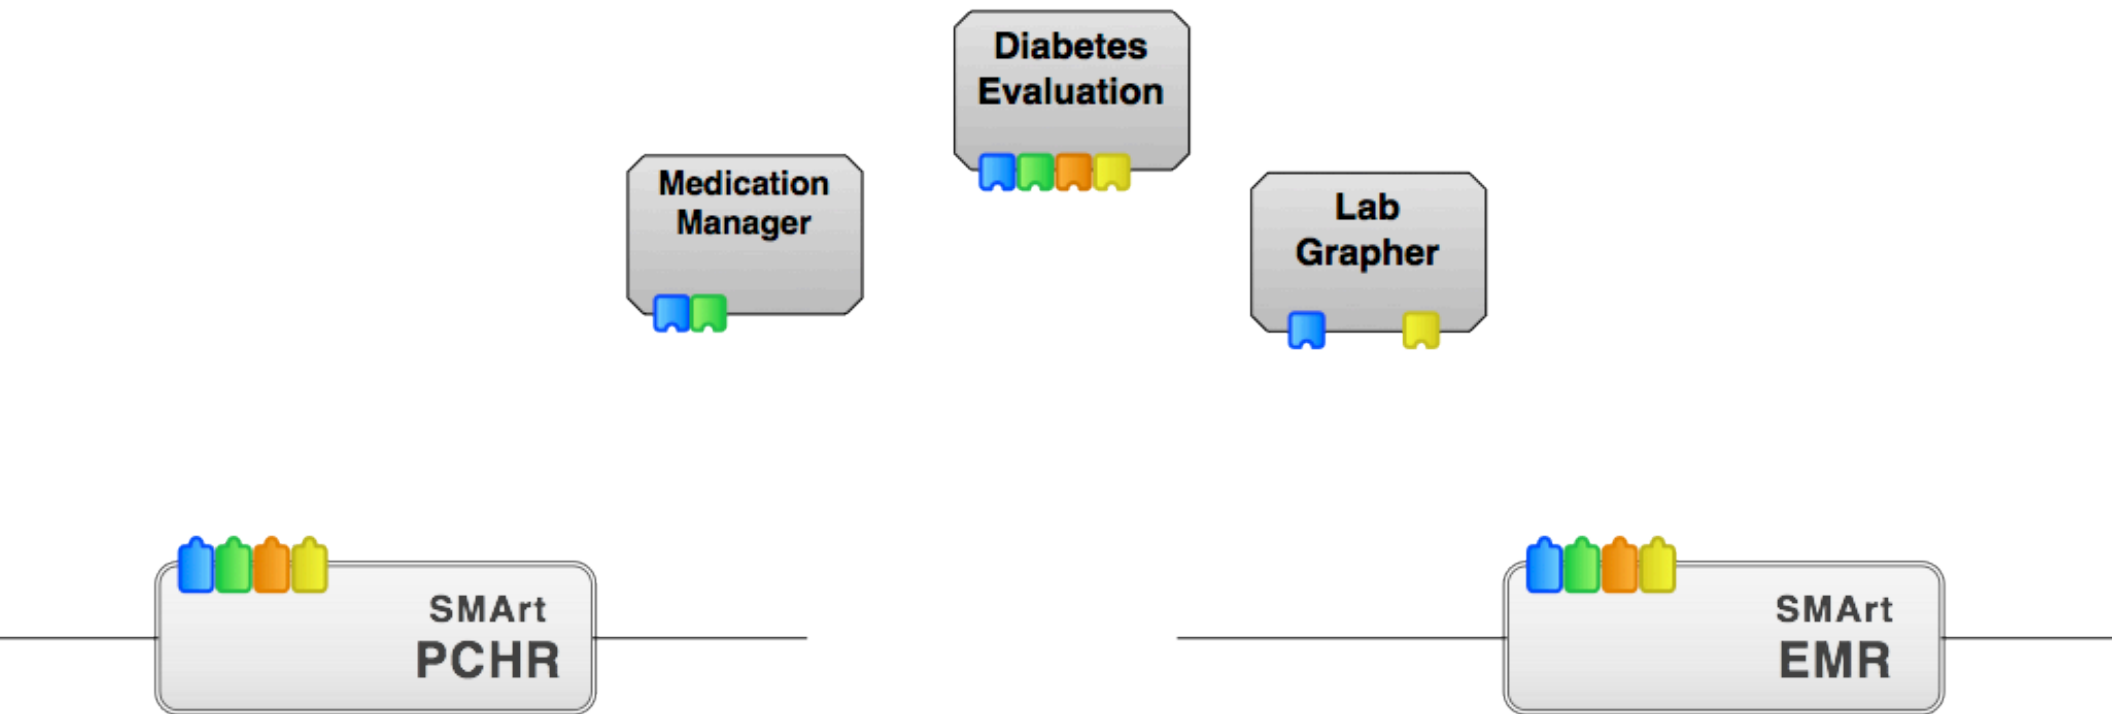

Children's Hospital  
Informatics Program

Harvard  
Medical School

**Substitutability  
works both ways—  
the containers can also be swapped out**

Intelligent Health Lab

Children's Hospital  
Informatics Program

Harvard  
Medical School

## Governance

- **code**: open-source, open formats, led by SMArt team
- **app store**: one app exchange to start, but others can be built. Installations manage their app gallery. Users manage their dashboards.
- **brand**: compliance test to ensure that “SMArt” is meaningful

Intelligent Health Lab

Children's Hospital  
Informatics Program

Harvard  
Medical School

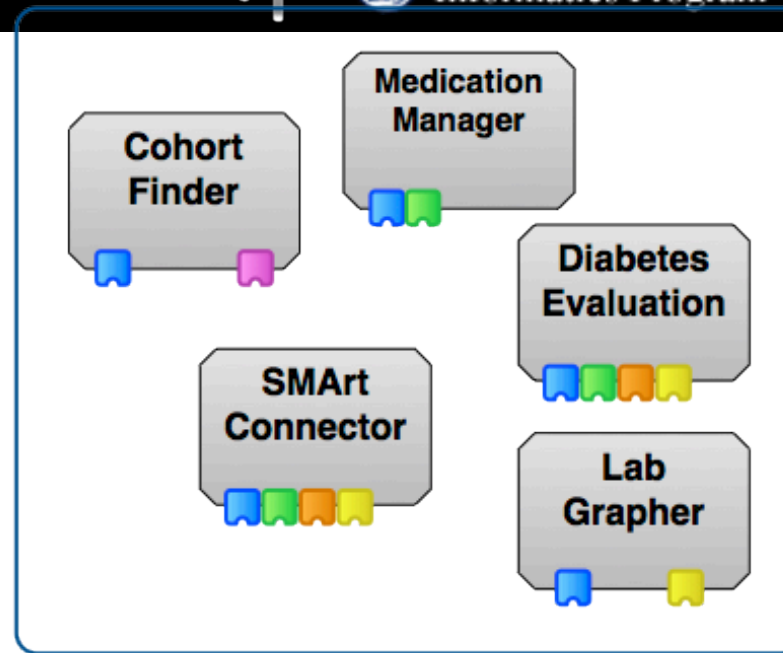

## "App Store"

- The SMArt App Exchange will feature apps approved by the SMArt committee
- Other organizations can operate and vouch for alternate app exchanges
- Each SMArt container installation will decide which apps it wants to feature in its App Gallery
- Each user may select his preferred apps placed in his App Dashboard

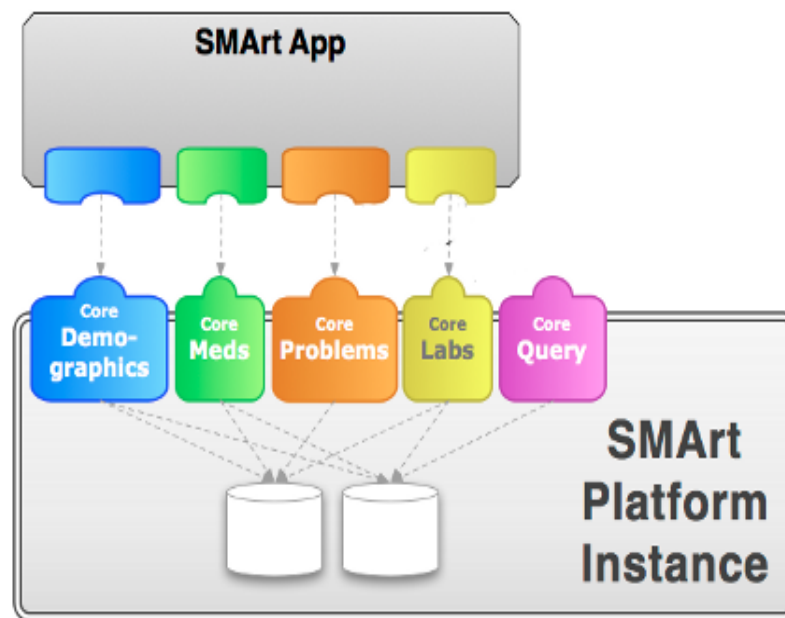

It is not  
the wild  
west

## Substitutable Medical Apps, reusable technologies

A platform with substitutable apps constructed around core services is a promising approach to driving down healthcare costs, supporting standards evolution, accommodating differences in care workflow, fostering competition in the market, and accelerating innovation.

## SMART Health App \$5000 Challenge

As announced by US Chief Technology Officer Aneesh Chopra on November 9, 2010, during his mHealth Summit keynote address with Bill Gates, SMART seeks to recruit and support a new generation of innovators by providing a common interface to multiple HIT platforms.

The SMART Health App \$5,000 Challenge is to develop web apps that use the SMART API to provide value to patients, providers, researchers, and public health. Examples of such applications are medication management tools, health risk detectors, and e-prescribing applications. The challenge will open in March 2011. More information is [here](#) and you can register your interest in the form to the right.

### Challenge Registration

Sign up to register your advance interest in the Challenge. You will receive updates and a link to the formal registration site for the March 2011 SMART Health App \$5,000 Challenge.
